

Beta Isolation Acceptance Test

Turnrow multi-tenant — run end to end **before inviting any real beta farm**. About 20 minutes. Requires migrations through 055 applied. Fill in the results table on the last page.

What you need

- A second email address you can check (a personal gmail is perfect).
- A **private / incognito browser window** — so the test login and your real login never mix.
- Your production domain, and your existing partner token (the `PARTNER_API_TOKEN` value in Vercel → Settings → Environment Variables).

Setup (once)

1. As **stuart@turnrow.farm**, go to **/admin** → under "Create an organization" type **Beta Test Farm** → Create.
2. In the Beta Test Farm row, type your second email → **Invite**.
3. Still on /admin: click **Partner token** on the Beta Test Farm row. **Copy the token now** — it is shown once. This is `TEST_TOKEN` below.
4. In the **incognito window**: open the invite email, click the link, set a password. You are now signed in as the test user.

Check (a) — the test user sees ZERO Turnrow data

In the incognito window, click through every page: Loads, Bin Inventory, Contracts, Settlements, Yields, Hedging, every report under Reports, and Settings → Entities / Farms / Fields / Crops.

Expect: empty states everywhere. Crops shows exactly the four seeded crops (Corn, Soybean, Wheat, Grain Sorghum). No Turnrow entity, farm, field, or buyer name anywhere — including inside dropdown filters.

FAIL if: any Turnrow name or number appears on any page or in any dropdown.

Check (b) — direct links to Turnrow records

1. In your normal window: open one of your loads and copy its URL (`/loads/<id>`). Do the same for one settlement.
2. Paste both URLs into the incognito window.

Expect: a not-found / empty page both times — never your data.

Check (c) — partner API tokens are org-scoped

In PowerShell (replace the domain and the two tokens):

```
curl.exe -s -H "Authorization: Bearer YOUR_TURNROW_TOKEN" "https://YOUR-DOMAIN/api/partner/v1/fields"

curl.exe -s -H "Authorization: Bearer THE_TEST_TOKEN" "https://YOUR-DOMAIN/api/partner/v1/fields"

curl.exe -s -H "Authorization: Bearer wrong-token" "https://YOUR-DOMAIN/api/partner/v1/fields"
```

Expect: 1st — your Turnrow fields (non-empty). 2nd — an empty list (the test farm has no fields; after check (e) it must return ONLY test-farm rows). 3rd — `{"error": "Unauthorized"}` .

FAIL if: the test token ever returns a Turnrow field.

Check (d) — uploads land in the test org's storage folder

- 1. As the test user: Loads → Scan → upload any PDF or photo (parsing may fail — that's fine, it's not the test).
- 2. Supabase dashboard → Storage → documents.

Expect: the new file sits inside a folder named with a long uuid (the test org's id) — not at the top level, and not in Turnrow's folder.

Check (e) — test-farm data never appears in YOUR session

- 1. As the test user: create one entity ("Acceptance LLC"), one farm, one field, and one manual load.
- 2. In your normal window: check Settings → Entities, the Loads page, Yields, and a report's entity dropdown.

Expect: none of the test rows anywhere in your session. On /admin the Beta Test Farm COUNTS go up — that is metadata and is supposed to happen; the records themselves must never appear.

Afterwards

Keep Beta Test Farm as a permanent staging farm and re-run this checklist before each future beta invite (recommended). If any check fails: stop, do not invite anyone, and report exactly what you saw and on which page.

Results

Check	Date	Pass?	Notes
(a) zero Turnrow data on every page			
(b) URL probes → not found			
(c) partner tokens org-scoped			
(d) upload in test-org folder			
(e) test data invisible to Turnrow
